

Use Case

eSIM - business travellers

Businesses with employees that frequently travel across the UK and internationally often encounter challenges with maintaining connectivity across different regions or countries. eSIMs offer a convenient solution by allowing employees to access multiple mobile networks without the need for physical SIM card swaps.

Reliable connectivity

By eliminating the need to manually swap SIM cards, employees can seamlessly transition to another mobile network wherever they go, whether they're in a bustling city like London or New York, or remote locations with limited coverage. eSIMs provide reliable connectivity so your business stays connected with minimised downtime.

Cost savings

Rather than incurring international roaming charges, employees can use eSIMs to access local rates & data plans in different destinations, improving communication expenses. This flexibility not only reduces operational costs for your business but also allows employees to tailor their connectivity options to their specific needs, enhancing overall efficiency.

Enhanced security

eSIMs provide enhanced security features critical for safeguarding your sensitive business data. With remote deactivation & encryption protocols, eSIM technology ensures that confidential information remains protected, even in transit. This added layer of security instils confidence in your business and employees, allowing them to stay connected and secure.
